

Credit Card Power BI Project – Overview

This document provides an overview of the Credit Card Transaction and Customer Analysis created using Power BI. It summarizes the project purpose, the problem it addresses, and the insights it delivers.

Problem Statement

Financial institutions handle millions of credit card transactions, but without proper analysis, they miss patterns related to revenue trends, customer behavior, card usage, and risk indicators. Decision makers need a clear, visual, and data-driven dashboard to understand performance and improve business strategies.

Project Purpose / What This Solves

The Power BI dashboard consolidates transaction and customer data to provide:

- Quarterly revenue and transaction trends
- Spending patterns by expense type (Bills, Travel, Fuel, etc.)
- Revenue contribution by customer job, card category, and age groups
- Insights on how customers use cards (Swipe, Chip, Online)
- Revenue and interest performance across states, income groups, and qualification

These insights help the business identify high-value customers, optimize card offerings, improve marketing strategies, and enhance revenue forecasting.

Conclusion

The project provides a complete analytical view of credit card performance, turning raw data into actionable insights. It supports smarter financial decisions and helps the organization understand customers more effectively.
